*Possessing all of the advantages of conventional sheet and post construction, including ease of repair, the Great Dane SSL surpasses today's standard plate and composite wall trailers with unmatched durability.*

## SSL FREIGHT VAN

### Single-Sided Laminate Interior Lining

The SSL's distinction is the durable construction of the interior lining. SSL panels are nearly six times more puncture resistant than standard plywood or four times stronger than plastic linings, resulting in lower maintenance and repair costs. This one-of-a-kind rigid interior lining protects exterior side sheets from unsightly scarring caused by interior damage.

### Sheet and Post Construction

Proven, risk-free design allows for greater variation in specifications and ease of repair.

### Flush Panel-to-Post Connection

Unique patented panel design wraps steel shroud around the edge of the core material and is then fastened to the post, independent of the side sheet, with recessed fasteners creating an anti-snag interior that prevents freight damage and assures ease of repair.

### Top rails are extruded specifically to create a square corner in the upper sidewall without protruding into the cargo area.

Provides an even 100" interior width from ceiling to floor, increasing cargo carrying capacity.

**Strongest rear frame in the industry with rear header to top rail connection reinforced at corners by massive .25-inch steel gussets, both top and side**  
Minimizes racking and ensures that the frame remains square throughout the life of the trailer

### Non-proprietary parts

Guarantees ease of repair and shorter downtime if maintenance is necessary.
